# InCase Platform

*Build, Operate and Optimise, so the estate performs as the business needs it*

InCase designs, builds and optimises the infrastructure that regulated and high complexity enterprises run on, with deep roots in the mainframe and the cloud and hybrid estates around it. Most estates were never designed as one. They grew through acquisition, outsourcing and successive technology choices, and each layer added cost, dependencies and operational risk.

The pressure shows up as rising run costs, resilience that has never been properly tested and performance problems nobody can trace. Platform work puts the foundations back under control.

Our specialists have built, sized and run mainframe and cloud estates where downtime is not an option, and recommend what fits the workload rather than what a vendor prefers. Platform covers three things:

- ✓ Build - Mainframe, cloud and hybrid foundations designed and built to fit the workload
- ✓ Operate - Observability, alerting and managed support that keep services predictable
- ✓ Optimise - Mainframe and cloud cost, performance and resilience improved

Our platform work follows the life of the estate. It starts with a clear view of what is running, what it costs and where it is fragile, designs and builds the target foundations, and then keeps them performing through monitoring, tuning and tested recovery. Each stage produces something the organisation can use on its own.

InCase Platform service can be used as a one off review, a mainframe sizing and procurement exercise, a design and build engagement or ongoing operational support. Platform Health Check is the most common place clients start. It establishes the baseline for cost, performance and resilience that every later decision is measured against.

Platform keeps the existing estate, mainframe included, well run, well sized and cost effective. Converting mainframe workloads to another platform belongs to InCase Modernisation, and an independent opinion on someone else's platform belongs to InCase Assurance.

**InCase experience.** Platform change in European financial services.

- ✓ **Core banking infrastructure** - Migration architecture, planning and stress testing for a core banking system moving from mainframe to private cloud
- ✓ **Enterprise cloud** - Retail banking workloads moved onto a new enterprise cloud platform with zero data loss and no unscheduled downtime
- ✓ **Cloud cost control** - Migration sizing, guardrails and a FinOps case that reduced monthly cloud spend across a banking estate

Every InCase engagement is consultancy led and outcome focused, drawing on decades of delivery in regulated environments where the decisions carry real risk. Our commitment is simple: an estate you can measure, explain and rely on.
